## Halo Occupation Distribution (HOD)

$P(N|M)$  probability for a halo of mass  $M$  to harbor  $N$  galaxies

$$\langle N \rangle_M = \int dN P(N|M) N_M,$$

$$\langle N(N-1) \rangle_M = \int dN P(N|M) N_M (N_M - 1).$$

$$\xi_{gg}(r) = \xi_{gg}^{1h}(r) + \xi_{gg}^{2h}(r).$$

$$\xi_{gg}^{1h}(r) = \frac{1}{2} \bar{n}_g^{-2} \int n(M) \langle N(N-1) \rangle_M \lambda(r|M) dM;$$

$$\begin{aligned} \xi_{gg}^{2h}(r) = & \xi_{mm}^{lin}(r) \bar{n}_g^{-2} \int n(M_1) b_h(M_1) \langle N \rangle_{M_1} dM_1 \\ & \times \int n(M_2) b_h(M_2) \langle N \rangle_{M_2} \lambda(r|M_1, M_2) dM_2 \end{aligned}$$

# Departures from the power law correlation function as predicted by the Halo Model

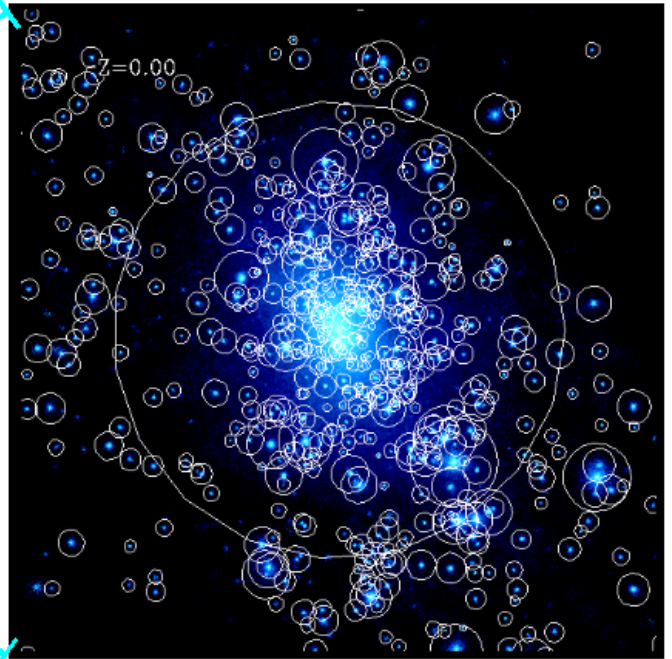

Zehavi et al. 2003

# HOD in dissipationless simulations

LCDM  $80h^{-1}$  Mpc;  $\sigma_8=0.75,0.9,1.0$ ;

$m_p=3.1 \times 10^8 h^{-1} \text{ Msun}$ ;  
 $\epsilon = 0.5 h^{-1} \text{ kpc}$

the Bound Density Maxima (BDM)  
halo finding algorithm  
(Klypin et al. 1999)

## Vmax - the poor man's (theorist's) luminosity

*to construct samples select all halos with  $V_{\text{max}} > \text{threshold}$*

### DDO 154

(Original HI data from Carignan & Purton, 1999)

*$V_{\text{max}}$  = the maximum of circular velocity curve*

# HOD of galactic halos

$$\alpha^2 \equiv \frac{\langle N(N - 1) \rangle}{\langle N \rangle^2}$$

Average number of galactic halos

Host halo mass

## Galaxies in a halo: central galaxy + a population of satellite galaxies

$$N(M) = N_s + 1$$

Virgo size cluster in a cosmological simulation  
with gasdynamics and starformation (Nagai & Kravtsov 2004)

# HOD of galactic halos

$$\alpha^2 \equiv \frac{\langle N(N-1) \rangle}{\langle N \rangle^2}$$

Average number of galactic halos

Host halo mass

# Anatomy of the HOD

$$\alpha^2 \equiv \frac{\langle N(N-1) \rangle}{\langle N \rangle^2}$$

$$= 1 - \frac{1}{\langle N \rangle^2}$$

# Satellite HOD: scaling with overdensity

Average  
number of  
galactic  
halos

Host halo mass

# Satellite HOD: scaling with overdensity

Average number of galactic halos

Host halo mass

## Average number of *satellites* as a function of halo mass (the first moment of the HOD)

$$\langle N_s \rangle = (M/M_1)^\beta$$

or more accurately:

$$\langle N_s \rangle = (M/M_1 - C)^\beta$$

$$M_1 \approx 20 - 30M_{\min}$$

$$C \approx 0.01 - 0.04$$

The scatter  
about the mean  
is Poisson

(astro-ph/0312036)

Tasitsiomi et al. 2004, in preparation

## Conclusions

□ The Halo Occupation Distribution can be understood as a sum of probabilities for a halo to host a central galaxy and a certain number of satellites.

The former is a step function, while the latter is Poisson pdf with the mean:  $\langle N_s \rangle = (M/M_1 - C)^\beta$

*This provides a simple accurate HOD model for data interpretation and Halo Model analyses*

□ Clustering of dark matter halos matches the clustering of the overall galaxy population rather well.

*Dark matter dynamics thus appears to be the primary driver of galaxy clustering.*
