
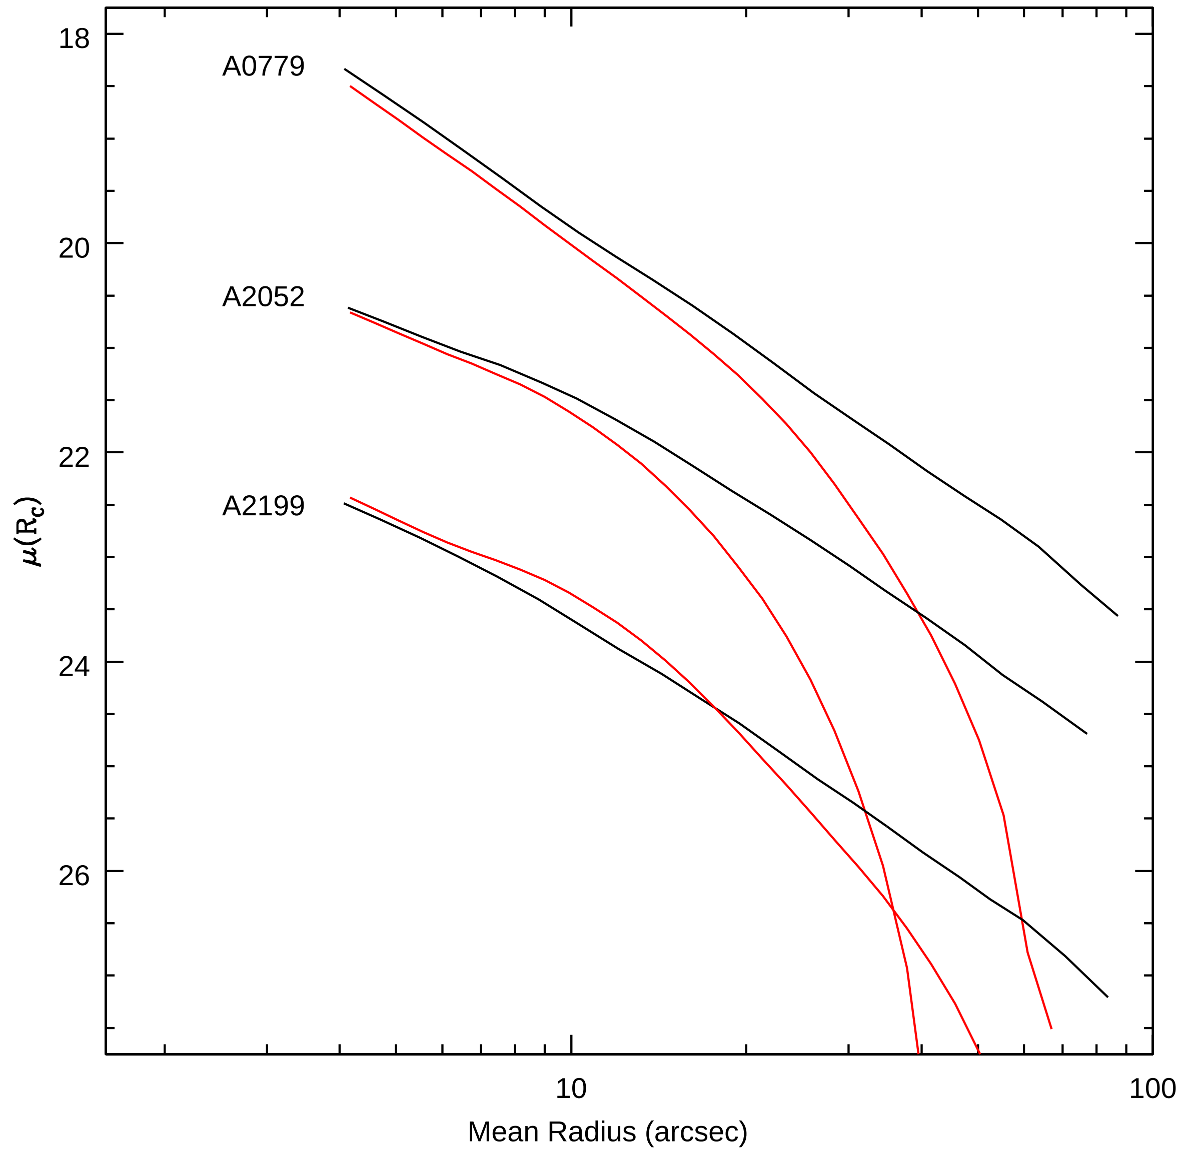

Fig. 13.— Surface brightness profiles from Postman & Lauer (1995) (black) are compared to "profmean" SDSS profiles (red) for three BCGs. The SDSS r band magnitudes are transformed assuming $R_C = r - 0.31$. The SDSS profiles all fall below the Postman & Lauer (1995) profiles at large radii, consistent with excessive sky subtraction by the SDSS pipeline.
